Local Options	8

# Options

The plugin allows users to pass in both global and local options.

## Note

Local options has a higher precedence than global options.

## Global Options

Some of these global options are used as default options when local options are not set. The global options are passed to the plugin through `mkdocs.yml` :

```
plugins:
  - pdf-generate:
      author: "Randy Duodu"
      author_logo: img/logo.svg
      copyright: "Copyright © 2022 - MkDocs PDF Generate"
      disclaimer: "Disclaimer: Content can change at anytime and best to refer to website
for latest information."
      cover: true
      cover_title: TITLE TEXT
      cover_subtitle: SUBTITLE TEXT
      custom_template_path: TEMPLATES PATH
      toc: false
      toc_level: 3
      toc_title: TOC TITLE TEXT
      toc_numbering: true
      cover_images:
        default: img/default.svg
        type1: img/type1.png
        type2: https://example.com/cover.svg
      enabled_if_env: ENABLE_PDF_EXPORT
```

### for Cover

#### **cover**

Set the value to `false` if you don't need a cover page.

**default:** `true`

#### **cover\_title**

Set the title text in cover page.

### Note

The following rule is applied when setting the value for cover title.

Cover Title precedence:

1. `title` (local pdf metadata option)
2. H1 heading for page
3. `cover title` (global)
4. `site_name` variable in your project's `mkdocs.yml`

**default:** use `site_name` in your project's `mkdocs.yml`

### `cover_subtitle`

Set the subtitle text in cover page.

### Note

The following rule is applied when setting the value for cover subtitle.

Cover Subtitle precedence:

1. `subtitle` (local pdf metadata option)
2. `type` (local pdf metadata option)
3. `cover subtitle` (global)

**default:** `None`

### `author`

Set the author text.

**default:** use `site_author` in your project's `mkdocs.yml`

### `author_logo`

Provide a logo image which you can use in the cover page.

Using SVG images as the value for author logo is recommended.

**default:** use `theme.logo` in your project's `mkdocs.yml`

#### **copyright**

Set the copyright text.

**default:** use `copyright` in your project's `mkdocs.yml`

#### **disclaimer**

Set the disclaimer text.

**default:** `None`

#### **cover\_images**

Set the cover image for specific document types.

The option takes a `key-value` pair where the `key` must be the same value as you specified for the `type` local pdf metadata option.

The `value` for a `key` must be the path to the image.

#### **Example:**

```
- pdf-generate:
  cover_images:
    default: img/home-banner.svg
    home: img/manual-banner.svg
    options: img/project-banner.svg
    customize: img/tutorial-banner.svg
```

### Note

Apart from the `default` key-value pair under `cover_images`, the other key-value pairs can have user-defined values.

Recommended: You must specify an image path for the `default` key-value pair. We will use the image as the cover image for any document that does not specify the `type` local pdf metadata option.

**default:** `None`

## for Heading and TOC

### `toc`

Set the value to `false` if you don't need a table of content section in the PDF document.

**default:** `true`

### `toc_title`

Set the title text for *Table of Contents*.

**default:** `Table of Contents`

### `toc_level`

Set the level of *Table of Contents*. This value is enabled in the range of from `1` to `3`.

**default:** `3`

### Note

The developers are working on extending the range for `toc_level` option from a value between `1-3` to a value between `1-6`.

... and more

### `custom_template_path`

The path where your custom cover template (e.g. `cover.html`) is located.

**i** Info

The custom template's filename should be `cover` with any of these file extensions `.html.j2`, `.html.jinja2`, `.html`, or `.htm`.

You can refer to this [example](#) about how to use a custom cover template.

**default:** `templates`

**enabled\_if\_env**

Setting this option will generate PDF files only if there is an environment variable set to 1. The environment variable must match the value of `enabled_if_env`.

This is useful to disable building the PDF files during development, since it can take a long time to export all files.

**default:** `None`

PDF generation can take significantly longer than HTML generation which can slow down MkDocs built-in dev-server.

Adding `enabled_if_env: ENABLE_PDF_EXPORT` disables PDF generation during development and runs the dev-server normally:

```
$ mkdocs serve
INFO      - Building documentation...
INFO      - PDF export is disabled (set environment variable ENABLE_PDF_EXPORT to 1 to enable)
INFO      - Cleaning site directory
INFO      - Documentation built in 0.54 seconds
INFO      - [08:51:24] Watching paths for changes: 'docs', 'mkdocs.yml'
INFO      - [08:51:24] Serving on http://127.0.0.1:8000/
```

and to build PDF files, set the `ENABLE_PDF_EXPORT=1` environment variable:

```
$ ENABLE_PDF_EXPORT=1 mkdocs build
...
INFO    -   Converting 2 files to PDF took 1.82s
INFO    -   Documentation built in 2.29 seconds
```

### **verbose**

Setting this to `true` will show all WeasyPrint debug messages during the build.

**default:** `false`

### **media\_type**

Allows you to use a different CSS media type (or a custom one like `pdf-generate`) for the PDF export.

**default:** `print`

### **theme\_handler\_path**

Allows you to specify a custom theme handler module. This path must be **relative to your project root** (See example below).

**default:** `None`

`mkdocs.yml`:

```
plugins:
  - pdf-generate:
      theme_handler_path: theme-handler
```

```
project-root
├─ theme-handler.py
├─ docs
├─ mkdocs.yml
├─ site
├─
└─
```

## Local Options

The plugin allows you to set document specific options using the Markdown page metadata. If a page metadata is specified, it has higher precedence than the [global options](#).

The local options are specified in the specific Markdown document you want to use:

```
---
pdf:
  - build: false
  - filename: Plugin Options
  - title: Options for MkDocs PDF Generate Plugin
  - type: Manual
  - revision: 0.2
---
```

The following options are available:

- build
- title
- subtitle
- type
- filename
- revision

### build

Allows you to specify whether to generate a PDF file for a Markdown file. Value is `true` or `false`.

### Note

The function of the build option is different from that of the [enabled\\_if\\_env](#). The `build` option disables PDF generation for a single Markdown file while `enabled_if_env` disables PDF generation for the entire project.

**default:** `true`

`title`

Set the title text in cover page.

`subtitle`

Set the subtitle text in cover page.

`type`

Set the document type.

**NB:** We use the value for this option in selecting the document's cover image from the [cover\\_images](#) option.

`filename`

Set the filename to use for a specific page when downloading the PDF document.

### Note

Filename precedence:

1. `filename` (local pdf metadata) - formatted such that all are valid characters
2. `title` (local pdf metadata) - formatted such that all are valid characters
3. H1 - formatted such that all are valid characters

`revision`

Set the revision text in cover page.
